# Improvement Recommendations

Prioritized product fixes and QA process enhancements

| | |
|---|---|
| **Product** | Cynbit public website and candidate portal |
| **Basis** | Tester observations #1–#21 and responsive pass notes |
| **Prepared** | 31 October 2026 |

## Recommended priorities

Priorities below reflect user impact, not an agreed release SLA. Resolve the high-impact journey issues first, then improve validation consistency and content clarity. No confirmed critical outage was observed.

## Priority 1 — address core journey and data-quality risks

### Repair the “Write us” action

Wire the button to its intended contact form or contact method, provide an accessible name and keyboard activation, and show a clear outcome. Verify at 375 × 667, 390 × 844, and 768 × 1024.

**References:** Observation #21

### Add a reliable close path to the mobile navigation

Keep a visible close control or toggle in the open menu. Support keyboard Escape on desktop, return focus to the opener, and ensure the close control remains available when the menu content scrolls.

**References:** Observation #19

### Normalize and validate required service-enquiry text

Trim leading/trailing whitespace on both client and server. Treat spaces-only values as empty and block submission with field-level messages. Apply consistently to IT Services, AI Suite, and Growth Engineering fields.

**References:** Observations #9, #11, #12

### Validate candidate application values and cross-field consistency

Reject future dates of birth, validate notice-period format, and check graduation year against education status. Use actionable field messages and keep valid international names supported.

**References:** Observation #5

### Ensure each track presents the correct syllabus

Map the syllabus to the selected Full Stack, QA & Test Automation, or other track. If content is intentionally shared, state that clearly in the interface.

**References:** Observation #16

## Priority 2 — improve input quality, content, and usability

### Use field-specific, inclusive name validation

Reject clearly malformed symbol-only values without a restrictive letters-only rule. Support Unicode letters, accents, spaces, apostrophes, and hyphens. Apply consistently to contact, AI Suite, IT Services, product, and SprintPulse forms.

**References:** Observations #7, #8, #10, #14, #15

### Reject spaces-only diary entries

Trim content and require meaningful text for the name, role/path, title, and story fields before queuing for review.

**References:** Observation #17

### Align assessment form labels with the QA task

Replace campaign/creative terminology with labels for deliverable links, evidence, and QA notes. Keep examples relevant to the assessment.

**References:** Observation #3

### Correct role-specific confirmation copy

Use a concise confirmation that names the QA internship application and confirms receipt/routing.

**References:** Observation #6

### Make sharing work or remove the misleading control

Use the Web Share API where available, provide a copy-link fallback, and display confirmation. Ensure the control has an accessible label and works on keyboard/touch.

**References:** Observation #18

### Decide and document mobile support access

Confirm whether the floating support-ticket button is intentionally hidden at narrow widths. If hidden, provide an obvious equivalent route and verify it does not compete with the fixed bottom navigation.
