CYNBIT / WEBSITE QUALITY AUDIT

QA Audit Report

Scope, methodology, execution environment, and coverage summary

Product	Cynbit public website and candidate portal
Test period	30–31 October 2026, based on the environment notes and follow-up observations
Approach	Manual exploratory and negative-input testing; observations and screenshots recorded

Executive summary

The audit covered public-site navigation and content, lead and application forms, selected Bitlevate learning flows, and the candidate assessment portal. There are 21 numbered observations and seven responsive pass notes recorded. The observation log contains confirmed functional/content issues, checks that remain inconclusive, and one responsive-availability observation requiring product confirmation.

The most consequential confirmed findings are: required service-enquiry fields accept whitespace-only values; the Contact page “Write us” call to action does not respond at any of the three tested viewport sizes; the open mobile navigation has no visible close control; career registration accepts invalid or inconsistent values; and different learning tracks display identical syllabus content.

Audit outcome at a glance

Classification	Count / references	Interpretation
Confirmed issues	16 observations: #3, #5–#12, #14–#19, #21	Observed behavior or content mismatch was recorded as occurring.
Needs product/design confirmation	Observation #20	Support-ticket floating control was absent at 375 × 667 but available at 768 × 1024; mobile access path/intent was not confirmed.
Inconclusive checks	Observations #1, #2, #4, #13	Submission, backend, or external-handler behavior was not verified; these should not be reported as confirmed defects.
Responsive passes	Seven pass notes	Candidate information, timeline, phase/deliverable content, notes and submit controls, and quick layout checks at 390 × 844 and 768 × 1024 were reported usable.

Scope

Included areas:

- Contact page and contact form; Careers QA internship application and confirmation.
- Service enquiry forms: IT Services Discovery, AI Suite Inquiry, and Growth Engineering.
- Product enquiry forms for Studio, TenantEase, and Revio; newsletter sign-up.
- Bitlevate SprintPulse Direct Sprint Registration, learning-path tracks and syllabus, and the candidate assessment portal.
- Write Your Diary form; IT Strategy blog article share control; mobile navigation and responsive candidate-page layout.

Methodology

- Manual exploratory testing of visible user flows and controls, using the website in Chrome.
- Negative-input checks included blank then whitespace-only fields, symbol-only or clearly malformed names, inconsistent education dates/status, and non-numeric notice-period text.

- Responsive inspection focused on visible content, horizontal overflow, wrapping/clipping, fixed bottom navigation overlap, and access to key controls.
- After observing validation prompts on blank values, selected fields were retried with spaces to determine whether trimming occurred. Screenshots were retained under matching observation numbers.

Test environment matrix

Dimension	Recorded environment / coverage
Operating system	Windows 11
Browser	Chrome 156.0.8078.48 (as recorded)
Desktop viewport	1920 × 1080
Responsive viewports	Chrome DevTools responsive emulation: 375 × 667, 390 × 844, and 768 × 1024. These are emulated viewports, not confirmed physical-device tests.
Network	Normal Wi-Fi
Test dates	30 October 2026 and 31 October 2026.

Responsive coverage matrix

Viewport	Coverage / result
375 × 667	Candidate name/reference code, timeline cards, phase/deliverable section, notes textarea, and submit button were reported readable and unobstructed; no horizontal scrolling. Mobile menu had no visible close control. Support-ticket floating button was not seen while scrolling. “Write us” did not respond.
390 × 844	Quick responsive layout check passed with no visible horizontal overflow or content overlap. “Write us” did not respond.
768 × 1024	Candidate content through the textarea and submit control was reported unobstructed with no horizontal overflow. Mobile menu had no visible close control. Support-ticket control was available. “Write us” did not respond.

Execution limitations and inconclusive checks

- The primary and additional assessment-link submission behavior was not tested; the assessment was not submitted. Missing inline feedback on blur is recorded, but acceptance/rejection on submit remains unknown.
- The support-ticket form was not submitted because doing so could create a real support request; required-field and length validation remain unverified.
- Newsletter success messages do not establish whether duplicate subscriptions were stored or whether trailing spaces were normalized.
- SprintPulse registration was stopped at the payment checkout; no payment was made.
- No API, backend database, accessibility automation, performance/load testing, or confirmed Edge execution is represented in this audit.

Evidence and interpretation

Observation numbers in the Bug & Issue Report correspond to the tester’s numbered notes and screenshot filename prefixes. Where no safe submit or backend verification was performed, the report labels the outcome as inconclusive or requiring confirmation rather than asserting a defect.
